

Build a webpage clone

Problem Statement

- You have to create a webpage which should look similar to that of the below given expected output image.
- If you want then you can use any google font of your choice in it like poppins or montserrat, but changing any colors or assets is not allowed in the webpage.
- Also your webpage should not be horizontally or vertically scrollable in laptop view, as it should fit the screen size properly i.e 100vh and 100vw.
- For getting the exact color code you can use any color picker extension in chrome.
- **Assets Link:** [Download Assets](#)

Expected Ouput Image

Note 1: It is not mandatory to make it responsive but if you will make, it will boost your creativity as you have to think of the mobile design by yourself. I will suggest you to take it as a challenge and try to make it responsive by your own.

Submission Process

Submission process is similar to that of the assignment submission through the dashboard.

Mandatory Process ([Process PDF Link](#))

Step 1: Create a local folder in your machine.

Step 2: Complete your assignment in that folder.

Step 3: Create a new repository on github for uploading this project over there.

Step 4: Upload your project in that repository by drag and drop or by using git commands (if you are aware of it).

Step 5: Submit the github repository link in the assignment submission of this project.

Optional Steps

Step 6: Deploy your project on github pages, netlify or vercel (if you are aware of these platform).

Step 7: Add the deployed link in the about section of your github repository.

Note 2: No extra marks or points will be given to you for hosting your project.

Note 3: Solution of this project will be provided to you after 1 week of uploading of this project, so it will be good if you are able to create and submit it within 1 week of time but there is no time limit is defined for its submission so take your time and create it.
